

## Selection statements

The selection statement allows a program to test several conditions and execute instructions based on which condition is true.

In Python, these are the types of selection statements:

- if.
- elif
- else.

Nb:

- Equals: `a == b`
- Not Equals: `a != b`
- Less than: `a < b`
- Less than or equal to: `a <= b`
- Greater than: `a > b`

### 1. *If* statement

Python *if* statement is **one of the most commonly used conditional statements in programming languages**. It decides whether certain statements need to be executed or not. It checks for a given condition, if the condition is true, then the set of code present inside the "if" block will be executed otherwise not.

Syntax:      ***if condition:***  
                 ***body***

```
x=56
y=10
if x>y:
    print(x,"greater than",y)
```

56 greater than 10

Q :Print "Hello World" if a is greater than b.

```

a = 100

b = 10

a b

print("Hello World")

```

## 2. elif statement

The elif keyword is Python's way of saying "if the previous conditions were not true, then try this condition".

Syntax:

```

if condition1:
    body1
elif condition2:
    body2
elif condition3:
    body3
.....
.....

```

```

score=eval(input("enter your score"))
if score<=100 and score>=90:
    print("A+")
elif score<=89 and score >=80:
    print("A")
elif score<=79 and score >=70:
    print("B")
elif score<=69 and score>=60:
    print("C")
else:
    print("FAIL")

#else - only one,last, no condition

```

```

enter your score76
B

```

## 3. else statement

In programming languages, an else statement is an alternative statement that is executed if the result of a previous test condition evaluates to false.

Syntax:

```
If condition:  
    body  
else:  
    Body
```

Example:

```
x=eval(input("enter a number"))  
if x>50:  
    print("pass")  
else:  
    print("fail")
```

```
enter a number67  
pass
```
